A; Accession: 140794
A; Status: preliminary; translated from GB/EMBL/DDBJ
A; Molecule type: DNA
A; Molecule type: DNA
A; Residues: 1-578 «KRU»
A; Residues: 1-578 «KRU»
A; Residues: 1-578 «KRU»
A; Residues: 1-578 «KRU»
A; Description: catalyzes the oxidation of dihydrolipoamide to lipoamide using NAD
A; Pathway: acetoin dehydrogenese enzyme system
A; Pathway: acetoin dehydrogenese enzyme system
C; Superfamily: Alcaligenes dihydrolipoamide dehydrogenase; dihydrolipoamide dehydrogenase
C; Keywords: FAD; flavoprotein; lipoamide, NAD; oxidoreductase; redox-active disulfide
F; 5-77/Domain: lipoyl/biotin-binding houcleotide-binding fold
F; 117-145/Region: beta-alpha-beta RAD nucleotide-binding fold
F; 119-56/Domain: dihydrolipoamide dehydrogenase homology «DLD»
F; 287-315/Region: beta-alpha-beta NAD nucleotide-binding fold
F; 153-158/Disulfide bonds: redox-active #status predicted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     R;Takami, H.; Nakasone, K.; Takaki, Y.; Maeno, G.; Sasaki, R.; Masui, N.; Fuji, F.; Hiran Nucleic Acids Res. 28, 4317-4331, 2000

A36028
DNA-directed DNA polymerase (EC 2.7.7.7) II catalytic chain - yeast (Saccharomyces Cerevi)
N;Alternate names: DNA-directed DNA polymerase II chain A; protein N0825; protein YNL262w, C;Species: Saccharomyces cerevisiae
C;Species: Saccharomyces cerevisiae
C;Species: Saccharomyces cerevisiae
C;Species: Saccharomyces cerevisiae
C;Accession: A36028; B56028; S60919; S63235; S65121
R;Morrison, A; Araki, H.; Clark, A.B.; Hamatake, R.K.; Sugino, A.
Ccell 62, 1143-1151, 1990
A;Title: A third essential DNA polymerase in Saccharomyces cerevisiae.
A;Reference number: A36028; MUID:90381771; PMID:2169349
A;Accession: A36028
A;Molecule type: DNA
A;Residues: 1-2222 <MOR>
A;Accession: B36028
A;Molecule type: protein
A;Residues: 1214-1216, X', 1218-1221 <MO2>

RISTUCTURAL and spectral response of green fluorescent protein

XT variants to changes in pH.";

RICHOCHMISTRY 38:5295-5301(1999).

RICHOCHMISTRY 38:5295-5301(1999).

C. I-FUNCTION: Energy-transfer acceptor. Its role is to transduce the blue chemiluminescence of the protein aequorin into green

Eluorescent light by energy transfer. Fluorescence in vivo upon receiving energy from the Ga (2+) - activated photoprocein aequorin.

C. Absorbs light maximally at 395 nm and exhibits a smaller absorbance peak at 470 nm. The fluorescence emission spectrum peaks at 509 nm with a shoulder at 540 nm.

C. SUBUNIT: Monomer.

C. SUBUNIT: Monomer.

C. SUBUNIT: Monomer.

C. Modified amino acid residues. The chromophore is formed upon conditied amino acid residues. The chromophore is formed upon cyclisation of the residues Ser-dehydrofyr-Gly.

C. Ordinarios as a fluorescent protein and ubiquitous tool for making chimeric proteins of GPP linked to other proteins where it fuortions as a fluorescent protein tag GPP toderates N-and C-terminal fusion to a broad variety of proteins. It has been expressed in bacteria, yeast, slime mold, plants, Drosophila, cebrafish, and in mammalian cells. As a noninvasive fluorescent marker in living cells, it allows for a wide range of applications where it may function as a cell lineage tracer, reporter of gene expression, or as a measure of protein-protein interactions.

NOTE=ISBUE II of June 2001;

C. Ordinario and C. Ordinary of protein-protein interactions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This SWISS-PROT entry is copyright. Aminoacyl-tRNA synthetase; Protein biosynthesis; Ligase; ATP-binding;
                           diphosphate + L-leucyl-tRNA(Leu).
SUBCELLULAR LOCATION: Cytoplasmic.
SIMILARITY: Belongs to class-I aminoacyl-tRNA synthetase family.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         REPLICATION.
-!- CATALYTIC ACTIVITY: N deoxynucleoside triphosphate = N diphosphate + {DNA}(N).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         -:- SUBUNIT: CONSISTS OF FIVE SUBUNITS (200 kDa, 80 kDa, 34 kDa, 30 kDa, AND 29 kDa).
-:- SUBGELIGIAR LOCATION: Nuclear.
-:- SUBGELIGIAR LOCATION: Nuclear.
-:- DOMAIN: THE DNA POLYMERASE ACTIVITY DOMAIN RESIDES IN THE N-TERMINAL HALF OF THE PROTEIN, WHILE THE C-TERMINUS IS NECESSARY FOR COMPLEXING SUBUNITS B AND C.
-:- MISCELLANBOUS: In eukaryotes there are five DNA polymerases: alpha, beta, gamma, delta.
-:- SIMILARITY: Belongs to the DNA synthesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              54 LPVPWP-TLVTTLSYGVQCFSRYPDHM------KQHDFFKSAMPEGYV----QERTI
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                883 LPKSFPETYFPTLENGKKLYLSYPCSMLNYRVHQKFTNHQYQELKDPLNYIYETHSENTI

CATALYTIC ACTIVITY: Obtusifoliol + 3 O(2) + 3 NADPH = 4-alphamethy. - 5-alpha-ergosta-8,14,24(28)-trien-3-beta-ol + formate + NADP(+) + 3 H(2)O.

PATHWAY: Ergosterol biosynthesis.
SIMILARITY: Belongs to the cytochrome P450 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Rossier M.;

Rapid detection and identification of Candida albicans and
Torulogais (Candida) glabrata in clinical specimens by
Torulogaic candida) glabrata in clinical specimens by
species-specific nested PCR amplification of a cytochrome P-450
lanosterol-alpha-demethylase (LIA1) gene fragment.";
J. Clin. Microbiol. 32:1902-1907(1994).

-!- FALTION: Catalyzes Cl4-demethylation of lanosterol which is
critical for ergosterol biosynthesis. It transforms lanosterol
into 4,4'-dimethyl cholesta-8,14,24-triene-3-beta-ol (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            PRINTS; PR00385; P450.

Bacteriol. 185:1018-1026(2003).
-!- CATALYTIC ACTIVITY: ATP + L-leucine + tRNA(Leu) = AMP +
diphosphate + L-leucyl-tRNA(Leu).
-!- SUBCELLULAR LOCATION: Cytoplasmic.
-!- SIMILARITY: Belongs to class-I aminoacyl-tRNA synthetase family.
                                                                                                                                                                                                                                                                                    Gaps

                                                            reveals hypervariable sequences.";
Nature 403:665-668(2000).
-!- FUNCTION: Catalyzes the formation of 5-methyl-uridine at position 54 (M-5-U54) in all tRNA (By similarity).
-!- CATALYTIC ACTIVITY: S-adenosyl-L-methionine + tRNA = S-adenosyl-L-homocysteine + tRNA containing thymine.
-!- Similarity: Belongs to the RNA M5U methyltransferase family. TrmA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Quail M.A., Rajandream M.A., Rutherford K.M., van Vliet A.H.M., Whitehead S., Barrell B.G.; "The genome sequence of the food-borne pathogen Campylobacter jejuni
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

Novel fluorescent protein in in vitro assay for measuring protein kinase activity or dephosphorylation activity, or for measuring protein redistribution, has a green fluorescent protein with F64L and E222G mutation.

Claim 9; Page 37; 41pp; English.

```
The invention relates to a fluorescent protein derived from green fluorescent protein (GFP) or its analogue. The GFP containing mutations at FactL and B2226 has a bigger compared to other GFPs making it very suitable for high throughput screening due to better resolution. The fluorescent protein is useful in invitro assays for measuring protein kinase activity or dephosphorylation activity, or for measuring protein redistribution. The fluorescent protein is useful in studying celling in the fluorescent protein is a protein tags in transgenic animals, living and fixed cells; organelle tags, secretion marker and genetic reporter. The fluorescent protein is also useful as a call or organelle integrity marker, a marker for changes in combination with fluorescence activated cell sorting (FACS). The novel proteins can also be used as reporters on monitor live or dead biomass of corganisms, such as fungi. The fluorescent protein is also useful as markers in transcriptional and translational protein are for bacterial detection. Transposons encoding the fluorescent protein are useful for screening promoters and for tagging plasmids and chromosomes. The fluorescent protein encoding the fluorescent protein for designing diagnostic tool. The present sequence is a DNA encoding cenhanced F641-E222G jellyfish green fluorescent protein (GFP) mutant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         LVTTLSYGVQCFSRYPDHMKQHDFFKSAMPEGYVQERTIFFKDDGNYKTRAEVKFEGDTL 120

The invention relates to a novel cell, comprising three heterologous conjugates (HC), a first HC (HCI) comprising an anchor protein that specifically binds to an internal structure within the cell conjugated to an interactor protein (IP) of type A, a second HC (HC2) comprising IP of type B conjugated to a first protein of interest, and a third HC (HC3) comprising a second protein of interest conjugated to detectable group. The cell is useful for detecting if a compound disrupts or induces the interaction between two intracellular proteins. The cell is also useful for accompandate the interaction between two exemplification of the invention
                                                                        Novel cell for identifying modulators of protein interaction, contains a first conjugate comprising anchor protein, second conjugate having type B interactor protein and third conjugate with detectable group.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    120

The invention relates to determining, if a compound, is a dislocator of PDB4. The method comprises testing if the compound removes PDB4 spots, which may optionally be induced by a Rolipram-like reference compound, and testing if it inhibits the catalytic activity of the PDB4, where the compound is a dislocator of PDB4, if it removes PDB spots and if it does not inhibit the catalytic activity of PDB4. The method is useful for dientifying compounds useful for the treatment of diseases of the central nervous system such as joint inflammation, Crohn's diseases of the central nervous system such as joint inflammation, Crohn's disease, inflammatory bowel disease, respiratory diseases, chronic obstructive pulmonary disease (CDP), including asthma, chronic bronchicis, pulmonary emphysema, psoriasis, bone resorption diseases, reperiusion injury, cancer and HIV infection. The use of a reagent that can mimic or reverse the effect of the compound with affinity for the catalytic site on intracellular distribution of the PDB for the preparation of a medicament. The present sequence represents the amino acid sequence of a HSPDB4A1-E222G fusion
                                                                                                                                        Determining if a compound is a dislocator of PDB4 for identifying compounds for treating CNS and inflammatory disease comprises identifying compounds which remove PDE4 spots.
